EXPERIENCE

Seek and Deploy, *May 2026 - Present*

Denver, CO

Developer Internship

- Architected and built a full-stack internal time-tracking application from scratch (Nuxt 4, Vue 3, Supabase/Postgres), including a relational schema for clients, projects, employees, and time entries and 15 REST endpoints supporting full CRUD, dynamic routing, per-project CSV export, and per-user weekly hour totals.
- Built email-invite authentication and account provisioning for the time-tracking app using Supabase Auth and Nuxt route middleware, replacing open signup with a secure invite, a confirmation, and a set-password flow to restrict access to admin-approved employees.
- Helped develop marketing and portfolio websites for 6+ client brands using Nuxt 3/4 with Sanity and Contentful as headless CMSs, architecting reusable page-builder systems that let non-technical clients compose pages from schema-driven content blocks.
- Owned technical SEO across the client portfolio and built shared composables and utilities for canonical URLs, JSON-LD structured data, and CMS-driven Open Graph/meta defaults with fallbacks, plus automated sitemap.xml, robots.txt, and llms.txt generation, delivering a consistent SEO layer across multiple sites.
- Collaborated across a professional Git workflow spanning multiple repos, which involved branching, resolving merge conflicts, and iterating on designer feedback to deliver responsive, mobile-through-desktop layouts using SCSS design systems (tokens, mixins, typography).

Geological Mapping Web Application, *August 2025 - Present*

Golden, CO

Developer

- Engineered a full-stack web application for interactive geological data visualization, implementing map-based rendering and client-side filtering of spatial datasets.
- Designed a data pipeline to extract and normalize legacy geological records, converting them into GeoJSON for efficient spatial representation and transport.
- Implemented a RESTful backend using FastAPI (Python) to serve geospatial data, integrating SQL queries against a Supabase-hosted database for structured metadata and spatial indexing.
- Developed a JavaScript/React frontend with modular components and state management to support dynamic map interactions and dataset filtering.
- Optimized data access and transfer by separating spatial payloads (GeoJSON) from relational attributes, reducing frontend load and improving responsiveness.
- Deployed and maintained the system in a Linux environment, using Git-based workflows for version control, testing, and collaborative development.

TECHNICAL SKILLS

Languages: C, JavaScript, Python, Java, HTML, CSS

Frontend/Backend: React, Vue, Nuxt.js, FastAPI, AWS, Git

EDUCATION

Colorado School of Mines, *August 2025 - May 2027*

Golden, CO

Master's of Science in Computer Science

Colorado College, *August 2017 - May 2021*

Colorado Springs, CO

Bachelor's of Arts in Economics

OTHER PROFESSIONAL EXPERIENCE

STACK Infrastructure

Denver, CO

Treasury Analyst, *July 2024 - August 2025*

Wilmington Trust, N.A.

Denver, CO

Client Administrator III, *October 2021 - June 2024*
